

## ABSTRAK

Telah dilakukan penelitian yang bertujuan membandingkan distribusi dosis berkas elektron 12 MeV hasil perhitungan TPS-Eclipse (AAA) dengan hasil simulasi Monte Carlo-EGSnrc. Simulasi Monte Carlo dilakukan dengan variasi *field size* dan variasi energi, penyinaran berkas elektron dilakukan pada *phantom* air berukuran 40x40x40 cm<sup>3</sup> dengan SSD 100 cm. Pada perbandingan dengan variasi *field size* (10x10 cm<sup>2</sup>, 15x15 cm<sup>2</sup>, 20x20 cm<sup>2</sup>, dan 40x40 cm<sup>2</sup>) diketahui bahwa hasil TPS-Eclipse (AAA) energi berkas elektron 12 MeV yang paling mendekati hasil simulasi Monte Carlo adalah pada *field size* 10x10 cm<sup>2</sup> dengan deviasi 0.06 %. Selanjutnya perbandingan variasi energi (12 MeV, 13 MeV, 14 MeV, 15 MeV, dan 18 MeV) *field size* 10x10 cm<sup>2</sup> hasil simulasi Monte Carlo dengan hasil TPS-Eclipse (AAA) energi 12 MeV *field size* 10x10 cm<sup>2</sup> didapatkan bahwa hasil TPS-Eclipse (AAA) terverifikasi dan hasil simulasi Monte Carlo tervalidasi pada energi 13 MeV untuk *field size* 10x10 cm<sup>2</sup> (deviasi 0.059 %). Oleh karena itu, hasil simulasi Monte Carlo energi berkas elektron 13 MeV untuk *field size* 10x10 cm<sup>2</sup> dapat dijadikan sebagai data pembanding pada *treatment planning* terhadap pasien.

Kata Kunci: Monte Carlo-EGSnrc, TPS-Eclipse (AAA), *field size*, energi, *treatment planning*, distribusi dosis, berkas elektron.

## **ABSTRACT**

*A study was conducted to compare the dose distribution of 12 MeV electron beam of TPS-Eclipse (AAA) calculation with Monte Carlo-EGSnrc simulation result. Monte Carlo simulation is done with variation of field size and energy variation, electron beam irradiation done on phantom water size 40x40x40 cm<sup>3</sup> with 100 cm SSD. In comparison with the variation of field size (10x10 cm<sup>2</sup>, 15x15 cm<sup>2</sup>, 20x20 cm<sup>2</sup>, and 40x40 cm<sup>2</sup>) it is known that the result of TPS-Eclipse (AAA) 12 MeV electron beam energy closest to Monte Carlo simulation result is in 10x10 cm<sup>2</sup> size field with deviation 0.06 %. Furthermore, the comparison of energy variation (12 MeV, 13 MeV, 14 MeV, 15 MeV, and 18 MeV) field size 10x10 cm<sup>2</sup> Monte Carlo simulation results with TPS-Eclipse (AAA) energy yield 12 MeV field size 10x10 cm<sup>2</sup> found that TPS-Eclipse (AAA) verified and Monte Carlo simulation results validated at 13 MeV for field size 10x10 cm<sup>2</sup> (deviation 0.059%). Therefore, the Monte Carlo simulation result of the electron beam energy of 13 MeV for the 10x10 cm<sup>2</sup> size field can be used as comparison data on treatment planning for the patient.*
